AMENDMENT TO THE CLAIMS

- 1. (CURRENTLY AMENDED) A method of managing events in a standard computer system comprising a central unit connected to memory units and peripheral devices by a data bus allowing a multimaster configuration, the method comprising the following steps:
 - receiving one or more events,
 - time-stamping each received event,
- storing each received event in a first memory and a second memory,
- assigning at least one appropriate action to each received event, and
 - executing that action in response to the received event,

which method is characterized in that the above-mentioned management steps are carried out in real time without access to the central unit by a management unit included in an independent management module connected to the data bus and incorporated into the standard computer system, and the first memory and the second memory are associated with the management unit, the first memory storing events to be processed by the independent management module and the second memory storing events so that these events may be read via the data bus;

wherein events received by the management unit which come from a unit adjacent the management module are resynchronized to a frequency corresponding to that of a clock internal to the computer system while events received from within the management module are received synchronized.

2. (CANCELLED)

3. (PREVIOUSLY PRESENTED) A management method according to

characterized in that the timescale of real-time claim 1,

management is of the order of one microsecond.

4. (PREVIOUSLY PRESENTED) A management method according to

claim 1, characterized in that the independent management module

is isolated from the central unit by a bridge.

(PREVIOUSLY PRESENTED) A management method according to

claim 1, characterized in that said action is read in a table of

actions associated with the management unit and is preprogrammed

via the data bus.

6. (PREVIOUSLY PRESENTED) A management method according to

claim 1, characterized in that events received by the management

unit are time-stamped to an accuracy of the order of

nanoseconds and stored in the second memory associated with the

management unit so that these events may be read via the data

bus in order to store and monitor these events.

A management method according to (PREVIOUSLY PRESENTED)

claim 1, characterized in that events received by the management

unit are generated by a clock register internal to the

management module.

8 - 10. (CANCELLED)

Confirmation No.: 4381

11. (PREVIOUSLY PRESENTED) A management method according to

claim 1, characterized in that events received from the external

equipment are filtered to eliminate interference.

12. (PREVIOUSLY PRESENTED) A management method according to

claim 1, characterized in that the management unit generates an

interrupt if it is not possible to associate an event with an

action.

(CURRENTLY AMENDED) Event management module incorporated

into a standard computer system comprising a central unit

connected to memory units and peripheral devices by a data bus

multimaster configuration, which а module

characterized in that it comprises:

- an independent management unit connected to the central

unit via an interface and the data bus, said management unit

being adapted to receive and process events in real time without

intervention by the central unit,

- a time-stamping clock adapted to time-stamp these events,

-a first memory associated with the management unit for

storing events to be processed by the event management module,

- a second memory associated with the management unit for

storing the events in order to read them via the data bus; and

of actions, associated with the management unit and adapted to

assign appropriate actions to events received thereby;

wherein events received by the management unit which come

- a random-access memory containing a preprogrammed table

from a unit adjacent the management module are resynchronized to

a frequency corresponding to that of a clock internal to the

computer system while events received from within the management

module are received synchronized.

(PREVIOUSLY PRESENTED) A management module according to 14.

claim 13, characterized in that the data bus is a standard bus

selected from the group comprising a PCI bus, a VME bus, a

compact PCI bus and a USB bus.

15. (CANCELLED)

(PREVIOUSLY PRESENTED) A management module according to

claim 13, characterized in that the first memory and the second

memory are of the FIFO type.

17. (PREVIOUSLY PRESENTED) A management module according to

claim 13, characterized in that the random-access

containing the table of actions is a double-port RAM.

18. (PREVIOUSLY PRESENTED) A management method according to

claim 2, characterized in that:

the timescale of real-time management is of the order of

one microsecond;

the independent management module is isolated from the

central unit by a bridge;

said action is read in a table of actions associated with

the management unit and is preprogrammed via the data bus;

events received by the management unit are time-stamped to

an accuracy of the order of 100 nanoseconds and stored in the

second memory associated with the management unit so that these

events may be read via the data bus in order to store and

monitor these events.

19. (PREVIOUSLY PRESENTED) A management method according to

claim 18, characterized in that events received by

management unit are generated by a clock register internal to

the management module.

20. (PREVIOUSLY PRESENTED) A management method according to

that received claim 18, characterized in events

management unit come from a unit adjacent the management module.

21. (PREVIOUSLY PRESENTED) A management method according to

claim 18, characterized in that events received

management unit come from an equipment external to the computer

system.

22 - 23. (CANCELLED)

24. (PREVIOUSLY PRESENTED) A management method according to

claim 21, characterized in that:

events received from the external equipment are filtered to

eliminate interference;

the management unit generates an interrupt if it is not

possible to associate an event with an action.

(PREVIOUSLY PRESENTED) A management module according to

claim 14, characterized in that:

the first memory and the second memory are of the FIFO

type.

26. (PREVIOUSLY PRESENTED) A management module according to claim 13, characterized in that:

the first memory and the second memory are internal to the management unit.
